# [Wave 2.19](#) (2024-04-16)

## New Features

- SP-11023147: APL Reminder Mails can be added to the Job History
- SP-11048526: New file extension: xlsb
- SP-11041269: System Health Monitor
- SP-11032183: Group list Excel export function

### 11023147 - Emails from the apl reminder service will be added to the job histories

With this extension it is now possible to configure the apl reminder service in a way that generated reminder emails are also added to the related job's history. There is a new configuration variable `reminder.mail.job.his` which is enabled by default, If this behavior is not intended it can be deactivated by setting it to false.

### 11048526 - New File Extension xlsb

With this change, it is now possible to configure that 'xlsb' files can be uploaded in Wave.

### 11041269 - System Health Monitor

With this new feature, a configurator can see basic information about the health of the current configuration of Wave. If a user has the reading level right for `sys-health` there will be a new main menu option in the options area. When the list gets displayed, Wave will review certain topics in the background and highlight those which can lead to issues. For example, empty language variables, duplicated jobfields, the amount of action queue entries or the existence of mandatory job fields. These are just some examples and the amount of reviewed settings can grow in the future by every release.

### 11032183 - Group List Export

Users with the reading right for `gru-exp` will have a new option which can download the list of existing groups and their information as Excel export. The export will include all groups from the current mandator or mand 0 which are currently not disabled.

# Bug Fixes

- SP-11046034: Show file category immediately without a manual reload needed
- SP-11047036: Display translated version of Nutri Category values
- SP-11048882: Fixed issues with updating questions
- SP-11045114: Better History entries for changes on job field block fields
