

Wave 2.21 (01.10.2024)

Breaking Changes

Project Layer Changes

To improve consistency across our project layer, Wave Projects will now use Wave IDs instead of the auto-increment ID from the project table. This change ensures that each project in Wave has a distinct and user-friendly numeric ID, clearly identifiable as a Wave ID. It also guarantees unique IDs across the entire system, preventing duplicate project IDs among multiple tenants.

Please refer to the migration guide in our Confluence documentation here:

<https://sgkservices.atlassian.net/wiki/spaces/W/pages/506890496/Project+Level+Migration>

New right for related jobs in the files tab

With 2.21 we have introduced a new reading right to Wave. If users need to access the related files section on the Files Tab in a job, then they need this right from now: job-fil-reltd

Ignore deleted helptable values when copying a job

When copying jobs, we expect the fields configured for copying to retain the same values in the new job. With this update, we are changing how we handle entries from helptable entries that were deleted. Previously, deleted helptable entries were still copied to the new job. Going forward, these deleted entries will be ignored, leaving the corresponding job field empty in such cases.

New Features

Logicbuilder improvements

With this release, we introduce new features that can be used in LogicBuilder scripts:

- 1) Including of other scripts to reuse in there defined functions
 - Acts like php's require_one
 - Detection of duplicate function declarations
 - Includes other scripts with the same branch (local, trunk or release) which the current script has
- 2) Added the ability to run Unit Tests and Benchmarks
 - Errors can now be shown as stacktraces
- 3) Added an option to store values for later calls
 - lb.store creates a new persistent object containing key/value items
 - Items will expire after 60 seconds by default but this can be extended
- 4) Added the option the skip or exit a running loop (continue & break)
- 5) Enhanced options for cache resource filtern, merging and projection
- 6) Added the ability to check or uncheck checkbox fields

Bug Fixes

- 11050194: Fixed php deprecated notices
- 11052683: Fixed issues with checking or unchecking checkboxes with the logicbuilder
- 11031658: Added language variable for the "Please select a workflow" Error if there was no apl template selected
- 11046032: Added Terms of Service on sgk_black design password recovery page
- 11045369: Values from job field blocks can now accessed by the logicbuilder
- 11050759: Show error message if the tableau connection is not properly configured
- 11050003: Old Dashboard cannot be reached anymore if it is not activated
- 11052881: Deletion of a picklist now appears also in the configlog
- 11050611: Fixed that the OnHold flag can be exported properly in job list exports

Wave 2.21.1 (26.08.2024)

Bug Fixes

- SP-11052983: Fix issues with logging changes on user data in hom-usr
- SP-11053377: Users need to have a right now to access related job on the files tab

Wave 2.21.2 (29.10.2024)

Bug Fixes

- SP-11052485: Fix issues with rights for general files folders with special characters in their names
- SP-11048967: Fixed that deleted helptable values are not used anymore when copying jobs
- SP-11050810: Fixed that emails from cancelling a job are missing from the job history
- SP-11053706: Fix issues with changing helptable entries on systems which have sso enabled
- SP-11053741: Fix Deeplink function for DalimES6
- SP-11052536: Fix missing values in user deactivation emails
- SP-11053366: Fix sending email notification on deactivating a user takeover
- SP-11053935: Fixed auto population of the approval loop deadline field

Wave 2.21.3 (19.11.2024)

Bug Fixes

- SP-11051625: Fixed copying projects

Wave 2.21.4 (28.11.2024)

Bug Fixes

- SP-11048882: Fixed updating changed questions from question lists in existing jobs
